In statistics, the logistic model (or logit model) is a widely used statistical model that, in its basic form, uses a logistic function to model a binary dependent variable; many more complex extensions exist. In regression analysis, logistic regression (or logit regression) is estimating the parameters of a logistic model; it is a form of binomial regression.

Logistic regression is another technique borrowed by machine learning from the field of statistics. It is the go-to method for binary classification problems (problems with two class values).

Logistic functions are used in logistic regression to model how the probability  $p$  of an event may be affected by one or more explanatory variables: an example would be to have the model  $p = \frac{1}{1 + e^{-ax}}$  where  $x$  is the explanatory variable and  $a$  and  $b$  are model parameters to be fitted and  $f$  is the standard logistic function.. Logistic regression and other log-linear models are also commonly used in ...
