Protein structure is the three-dimensional arrangement of atoms in an amino acid-chain molecule. Proteins are polymers – specifically polypeptides – formed from sequences of amino acids, the monomers of the polymer. A single amino acid monomer may also be called a residue indicating a repeating unit of a polymer. Proteins form by amino acids undergoing condensation reactions, in which the ...

In chemistry, an organic compound is generally any chemical compound that contains carbon. Due to carbon's ability to catenate (form chains with other carbon atoms), millions of organic compounds are known. Study of the properties and synthesis of organic compounds is the discipline known as organic chemistry. For historical reasons, a few classes of carbon-containing compounds (e.g., carbonates ...

A common approach to three-atom ring expansion termed –Hydrated Imidazoline Ring Expansion– (HIRE) has been developed. It is thought to involve the hydrated imidazoline intermediate which could be generated either by direct hydration of an activated imidazoline or via 2-aminoethyl side-chain addition to a lactam carbonyl group.
